PROJECT

Hackaton: VandyHack III, Vanderbilt University, Nashville, TN

November 11-13, 2016

TEAMMATES (Keishon Smith and Jameeyah Cody)

Link: devpost.com/software/eyeris

- **PROJECT EYERIS** uses 3 dimensional scans and area learning to find its location. The users' destination will then be represented as dots along the path or beeps within the ear.
- We used project tango's SDK within unity to assist with area learning, motion tracking and augmented reality. In addition, we used mesh construction when to create an object that could be exported into additional software.
- Our group learned how to use project tango and integrate it with hardware such as Arduino and software such as Unity. We also furthered our understanding in C#, C++, and electronic circuits.

EDUCATION BACKGROUND
